Efficiency and Redistributive Effects of Progressive Housing Taxation, joint with Anastasis Koufakis

Is it optimal to introduce progressivity in housing taxation? We explore this question by constructing a heterogeneous agent model featuring housing and entrepreneurship, calibrated to the Spanish economy. Our results indicate that a progressive housing tax can significantly enhance aggregate welfare and influence the economy through multiple channels. By imposing higher taxes on high-value properties, the policy curbs housing demand and lowers house prices—particularly benefiting lower-income and younger households. Moreover, it encourages rich households to reallocate savings from housing toward productive capital, thereby stimulating investment, output, and wages. In an economy with entrepreneurs the optimal tax design combines a flat income tax with a highly progressive housing tax, as elevated income tax rates at the top discourage business expansion. The equilibrium price effects and resulting welfare gains from this policy are amplified when housing supply is more inelastic.

Fiscal Implications of Atomistic Rental Supply – Job Market Paper, work in progress

This paper studies the household side of rental housing supply in Spain. The Spanish long-term rental market is highly atomistic, but this does not imply that supply is evenly distributed across households. Using administrative fiscal data, I show that landlords are positively selected in income, wealth, and age, and that landlords with more rented properties have higher income and lower exit rates. I then distinguish scale specialization, measured by the number of rented properties, from income specialization, measured by rental dependence. This distinction reveals a group of landlords who “live from rents” but are not especially rich relative to other landlords. Their rental income is meaningful, but their defining feature is very low non-rental income; many are retirees, and they are highly persistent suppliers of long-term rental housing. Short-panel evidence indicates that movements into higher rental dependence are associated mainly with declines in non-rental income, while rental income is comparatively stable.

The next step is to build a heterogeneous-agent model with endogenous landlord formation and household rental-supply decisions. The model will be used to study the distributional and supply effects of rental-tax policies, including the 60% income-tax deduction for long-term rental income, and to assess alternative policies aimed at expanding long-term rental supply.

Education

M.Res. Economic Analysis. Universidad Carlos III de Madrid, 2023.

B.Sc. in Economics. Universidad Complutense de Madrid, 2020.

Experience

Teaching Assistant Universidad Carlos III de Madrid. *Dynamic Macroeconomics*, (Spring 2021 and Spring 2022). *Macroeconomics I*, (Fall 2023, Fall 2024 and fall 2025).

Professional Internship at Analistas Financieros Internacionales, Afi (Consultancy) [07/2020-07/2021]

Short Courses and Summer Schools

Numerical Summer School, CFM-LSE. Prof. Wouter J. den Haan, 2023.

Advanced Methods in Difference in differences, Universidad Carlos III de Madrid. Prof. Scott Cunningham, 2023.

Quantitative Methods for Macroeconomics, Universidad Carlos III de Madrid. Prof. Evi Pappa, Spring 2023.

Continuous Time Numerical Methods, Universidad Carlos III de Madrid. Prof. Matthias Kredler, Fall 2023.

Honors & Awards

Ramon Areces Scholarship for PhD Thesis 2023-2026.

Master in Economic Analysis Scholarship, Universidad Carlos III de Madrid, 2021.

Research Collaboration Grant: "Forecast of Macroeconomic Variables". Universidad Complutense de Madrid, Spring 2020.

Skills

Programming: Julia, R, Matlab, Stata.

Languages: English, Spanish, Ukrainian, Russian.
